Business Applications Summit 2026

BUILD-A-THON

Time to get hands-on

Today's agenda

1. Introduction
2. Configure the Solution
3. Objectives
4. Follow Along Build
5. Questions

Ground Rules

This is an advanced session, so please feel free to help your neighbor, be a pal!

Screenshots are your friends, use them if you get lost.

If you have a questions or concerns, please raise your hand to ask. For more specific issues, you can get the attention of one of the coaches on the floor. If you happen to fall behind, the steps will be provided in this deck.

Objective for Power Platform Level 103

1. **Work with an existing Power Platform Solution**
   Explore solution components and extend features.

2. **Automate Data Creation**
   Remove manual data entry for inventory lists.

3. **Embed a Customer Page as your Home Page**
   Quickly turn your canvas app into a custom page.

4. **Use Power Automate to copy data between tables**
   Build flows that retrieve, map, and write Dataverse rows using Initialized variables to change the quantity of a field.

5. **Trigger Teams messages from a Power Apps–initiated flow**
   Pass data from a Canvas App into a flow and post structured updates to Teams.

Login

Helpful Tip: Create **Private Browser Profile** with your account profile (if possible) otherwise make sure to log out as needed

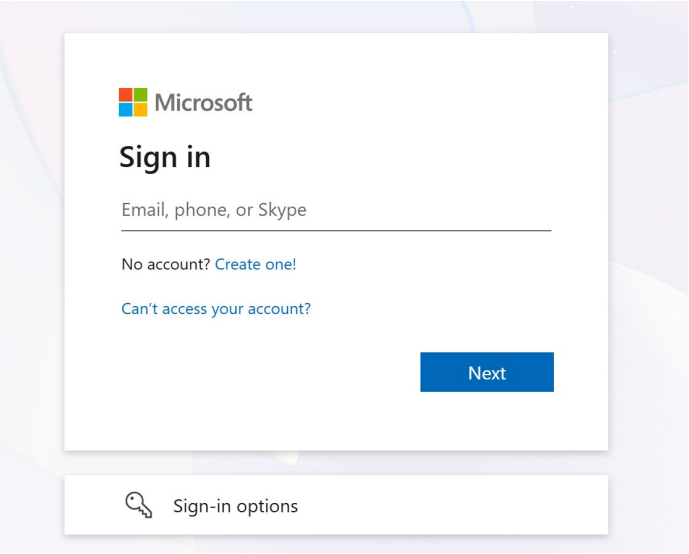
Step 1: Go to https://github.com/FedSolutions/gov-bizapps-copilot-summit-2026-buildathons
to download solution

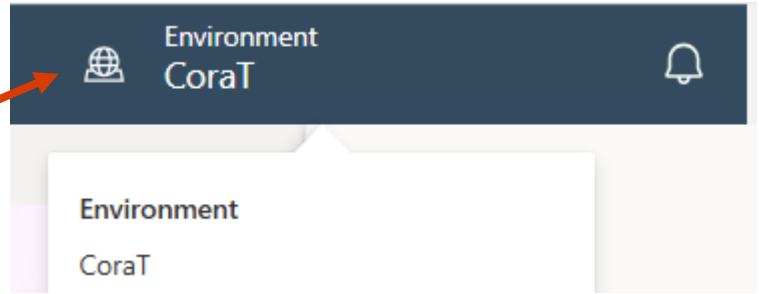
Step 2: Open Power Apps

- Go to **https://make.powerapps.com**
- Use the account profile provided at the door to sign in.

Username:	CoraT@M365CPI34979726.onmicrosoft.com
Password:	[redacted]
Environment:	CoraT

Note: Your account will be reflective of your first name and last initial





❑ **Make sure you double check you're in your proper environment**

Upload a Solution

Step 1: Go to Solutions

- In the left navigation, select **Solutions**

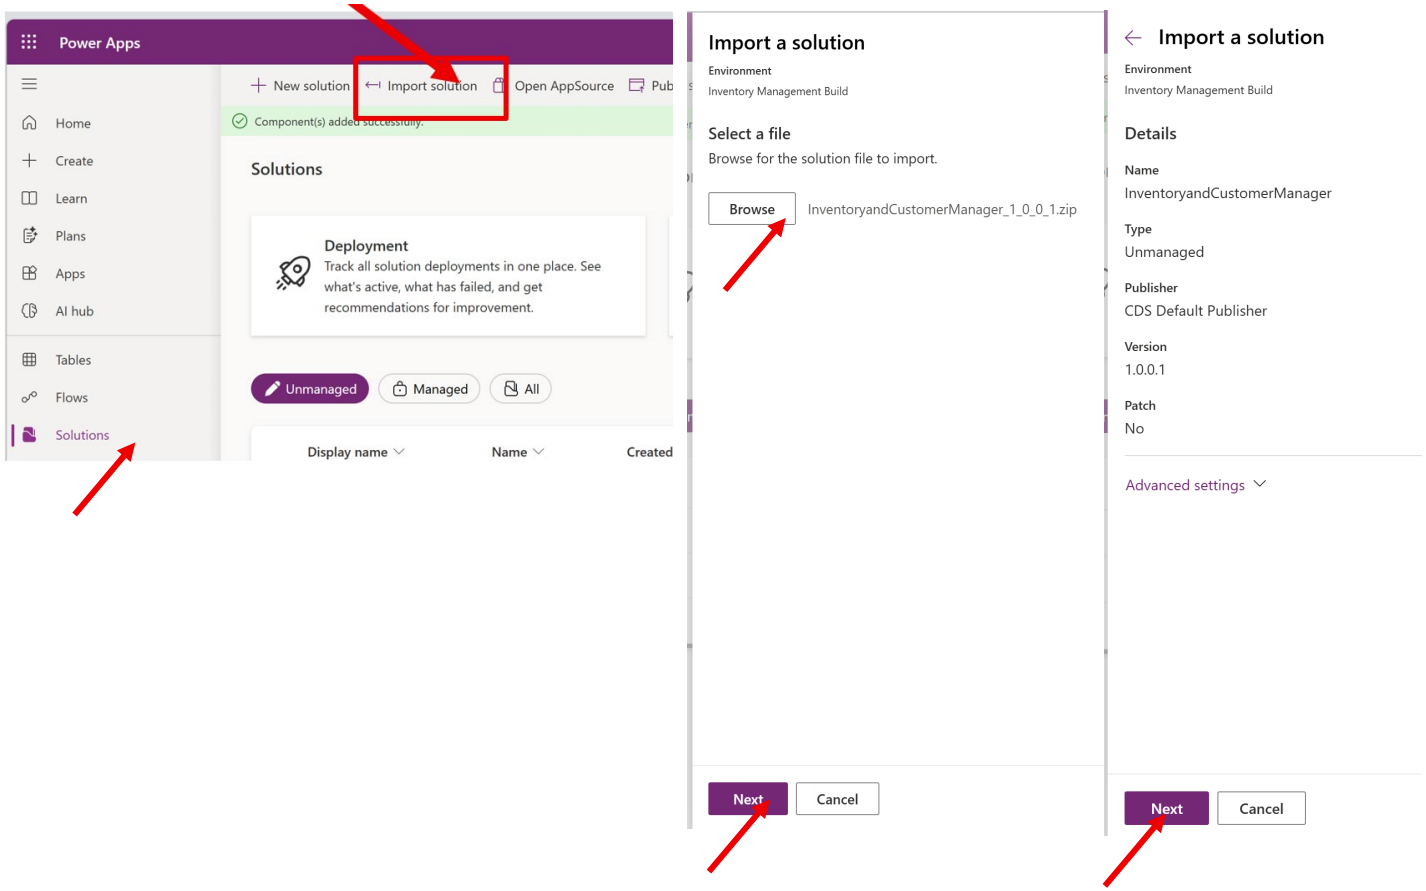
Step 2: Start the Import (Upload)

- Select **Import solution** (top command bar)
- In the dialog, select **Browse**
- Choose your solution **.zip file**

Step 3: Review Solution Details

- You'll see:
  - Solution name
  - Version number
  - Publisher
- Then Select **Next**

Note: Ignore Advanced Settings



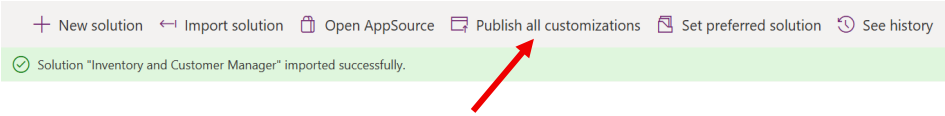
Upload a Solution

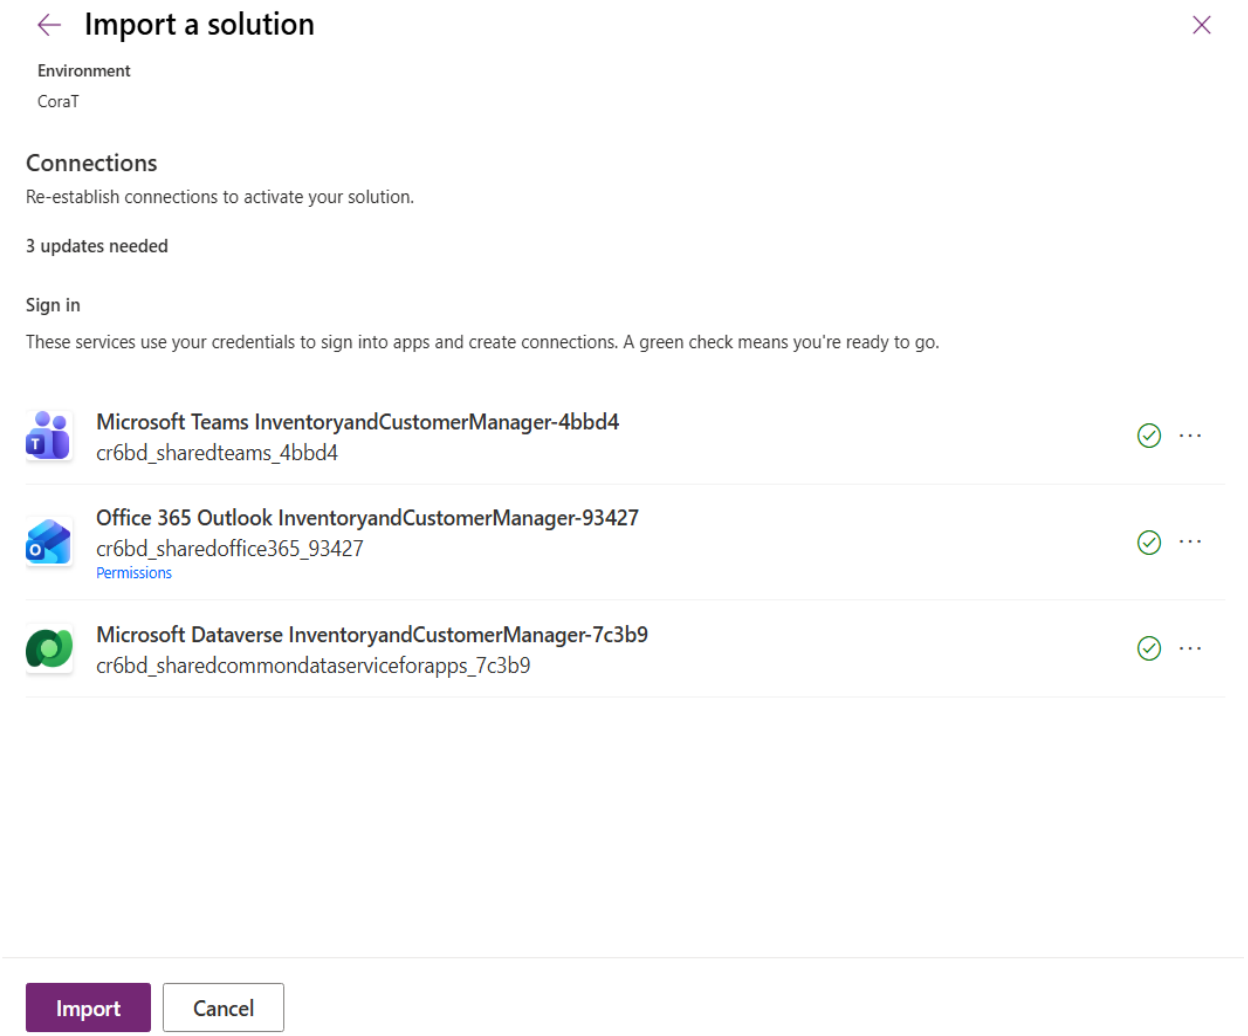
Step 4: Confirm you're logged in to each app.

- You'll see a green checkmark
  - Select the "…" to login
- Then Select **Import**

Once complete, you will see an "Import is Completed" notification

Make sure to "Publish All" after Import Completes:





Mission Brief
U.S. Army Recruiting Command Marketing Inventory

The **U.S. Army Recruiting Command (USAREC)** relies heavily on marketing and promotional materials to support community outreach, school visits, and recruiting events. Each Recruiting Station is responsible for maintaining stock levels of common items such as: Flyers, Pens, T-shirts

To modernize logistics and improve readiness, the battalion adopted a **Power Platform–based Inventory Management Application** to streamline how communications equipment is received, issued, tracked, and replenished.

They would like to add some additional automation into the system to help update the tables and send notifications in teams when inventory is low.

Background Scenario

Persona: SGT Steiner works at a Northern California Recruiting Station.

Day-to-day, **SGT Steiner**:

- Visits high schools, colleges, and community events
- Hands out Army-branded promotional materials
- Prepares for career fairs and presentations
- Requests restocks from the Battalion Marketing NCO

When SGT Steiner orders materials for an event, such as 50 flyers, 20 pens, and 10 T-shirts, he submits an order request through the Recruiting Station's Inventory Power App.

If the inventory drops below the minimum threshold, a notification should be sent to SSG Thomber.

Persona: SSG Thomber – Inventory NCO

SSG Thomber oversees purchasing and inventory management.

He relies on:

- Accurate inventory counts
- Immediate alerts when stock levels fall below thresholds
- Ability to update or add new items to the product list.

To avoid mission-impacting shortages, SSG Thomber needs automated, real-time notifications whenever equipment drops to critical levels.

Your Mission Execution Objectives
IF YOU CHOOSE TO ACCEPT IT

You will enhance the USAREC existing Inventory Management Application by building additional components that support this real-world scenario.

- ❑ **Import an existing solution**
  Must be able to customized an existing solution.

- ❑ **Use automatically created inventory data and reduce manual load**
  Avoid manual data entry with flow capabilities.

- ❑ **Embed a Customer Page as a home page**
  SGT Steiner needs to have the ability to order swag from the store.
  SSG Thomber will need to update the products from the list.

- ❑ **Use Power Automate to copy inventory values between tables and reduce inventory quantities**
  When SGT Steiner creates a sales order, your flow copies the unit price field from the inventory table to the sales order.

- ❑ **Trigger a Teams notification via a Power App flow**
  When inventory drops below minimum, a get alerted by a triggered flow that posts an alert to SSG Thomber in Teams.

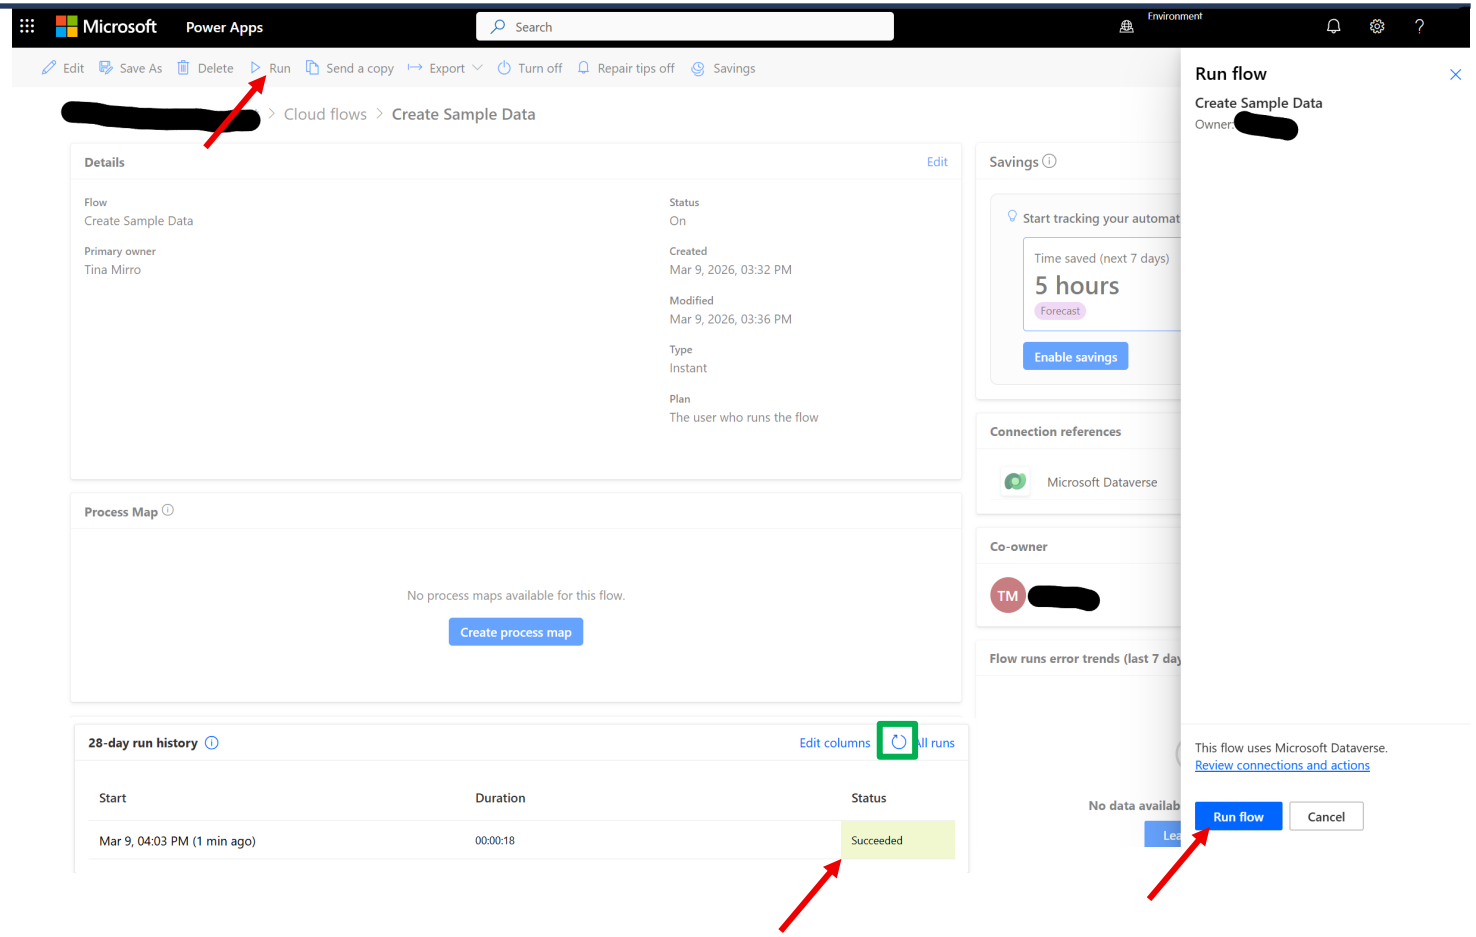
Walkthrough Demo

Data Import

Run Flow to Automatically Create Data

- Locate Cloud Flow “Create Sample Data”
  - Select “Solutions”
    - Select “Inventory and Customer Management” Solution under the Unmanaged Solution Tab
  - Navigate to “Cloud Flows”
    - Select “Create Sample Data” Flow
      - Then Select **Run**

Once complete, you will see a “Succeeded” line item in the Run Log (Refresh as needed)



Creating a Home Page

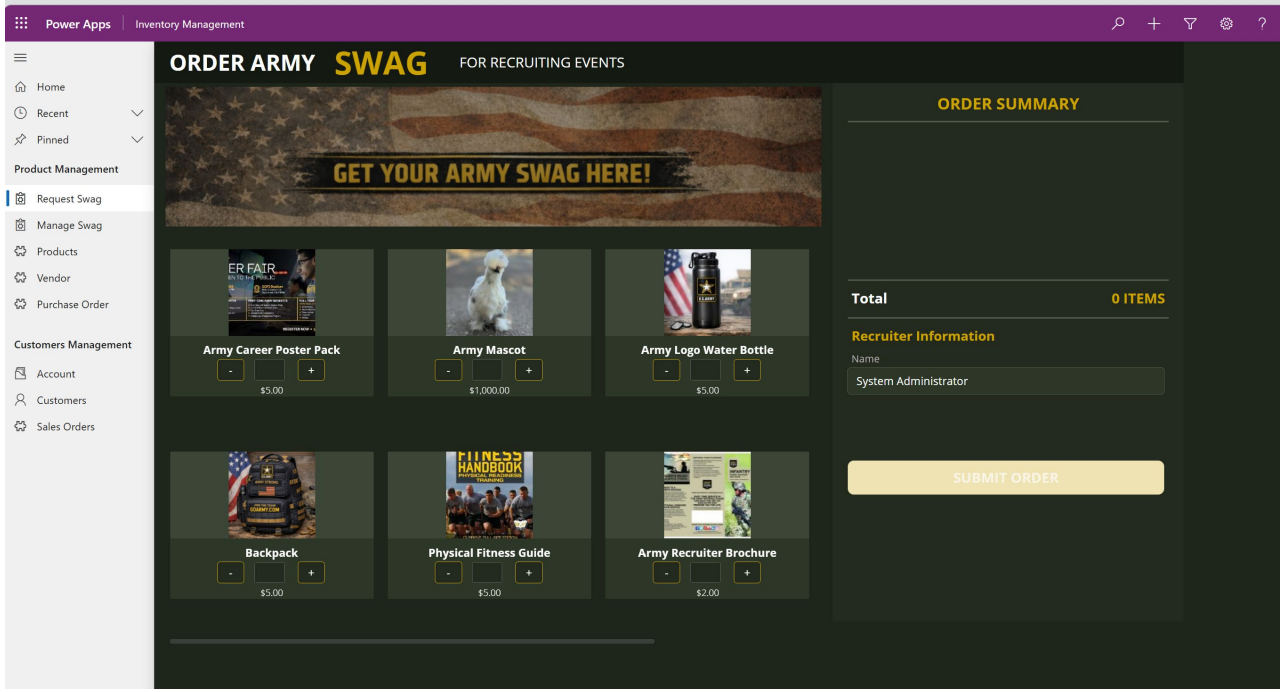
Why Custom Page in a Model-Driven App vs. Canvas App in Teams

In a Model-Driven App, a Custom Page keeps the experience natively inside Dataverse and the app shell same security model, same navigation, same data context.

This allows us to replace the default home for specific roles (like recruiters) without sending users to a separate app or Teams tab. Custom Pages can leverage model-driven features such as command bars, record context, and role-based navigation things a standalone Canvas App in Teams doesn't naturally inherit.

A Canvas App in Teams is great for lightweight or cross-team experiences, but it lives outside the model-driven workflow and requires users to context-switch.
For task-driven users like recruiters, a Custom Page as home means:

- Fewer clicks
- No app switching
- A purpose-built experience directly where they already work



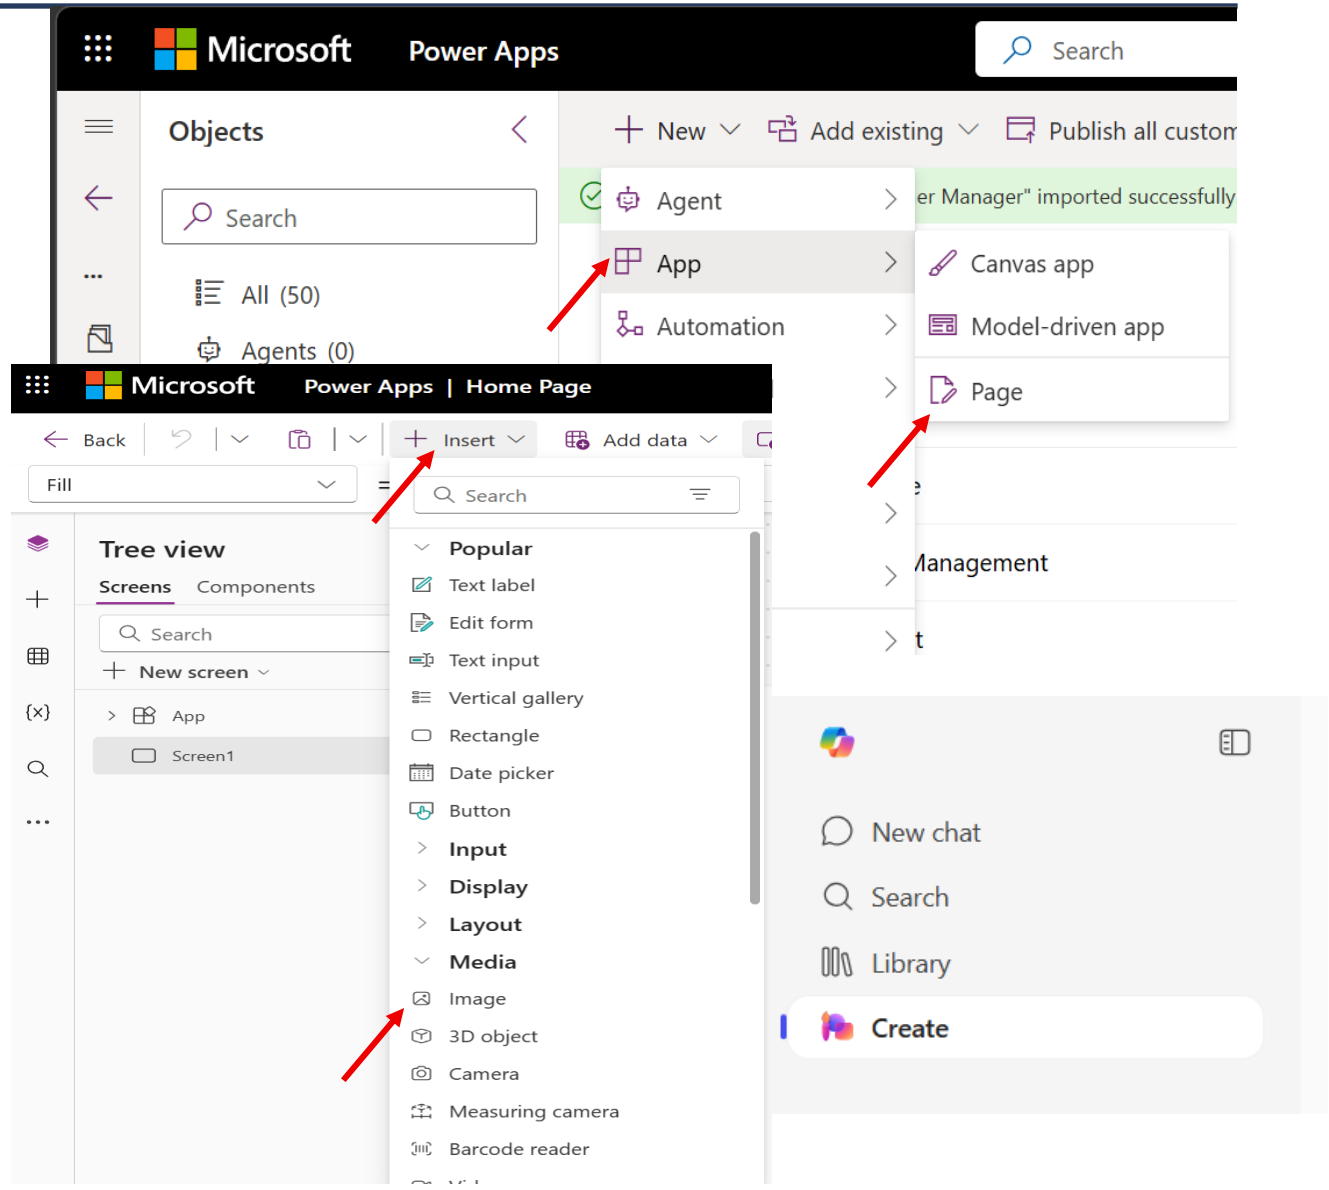
Creating a Home Page

Step 1: Create a Custom Page

- Go to **Power Apps** → **Solutions** (open the existing solution “Inventory Management”).
- Click **New** → **App** → **Page**
- Name it “Home Page” (Via Settings)

Step 2: Design Your Home Page

- Ask Copilot via the “Create” button to Create an Image sized for a canvas app for an Army Recruiting Swag Home Page and download the image
  - Might have to copy/paste the link URL
- Select **Insert** → **Media** → **Image**
- Click image placeholder and select **Upload** (Drag to Preferred Size)

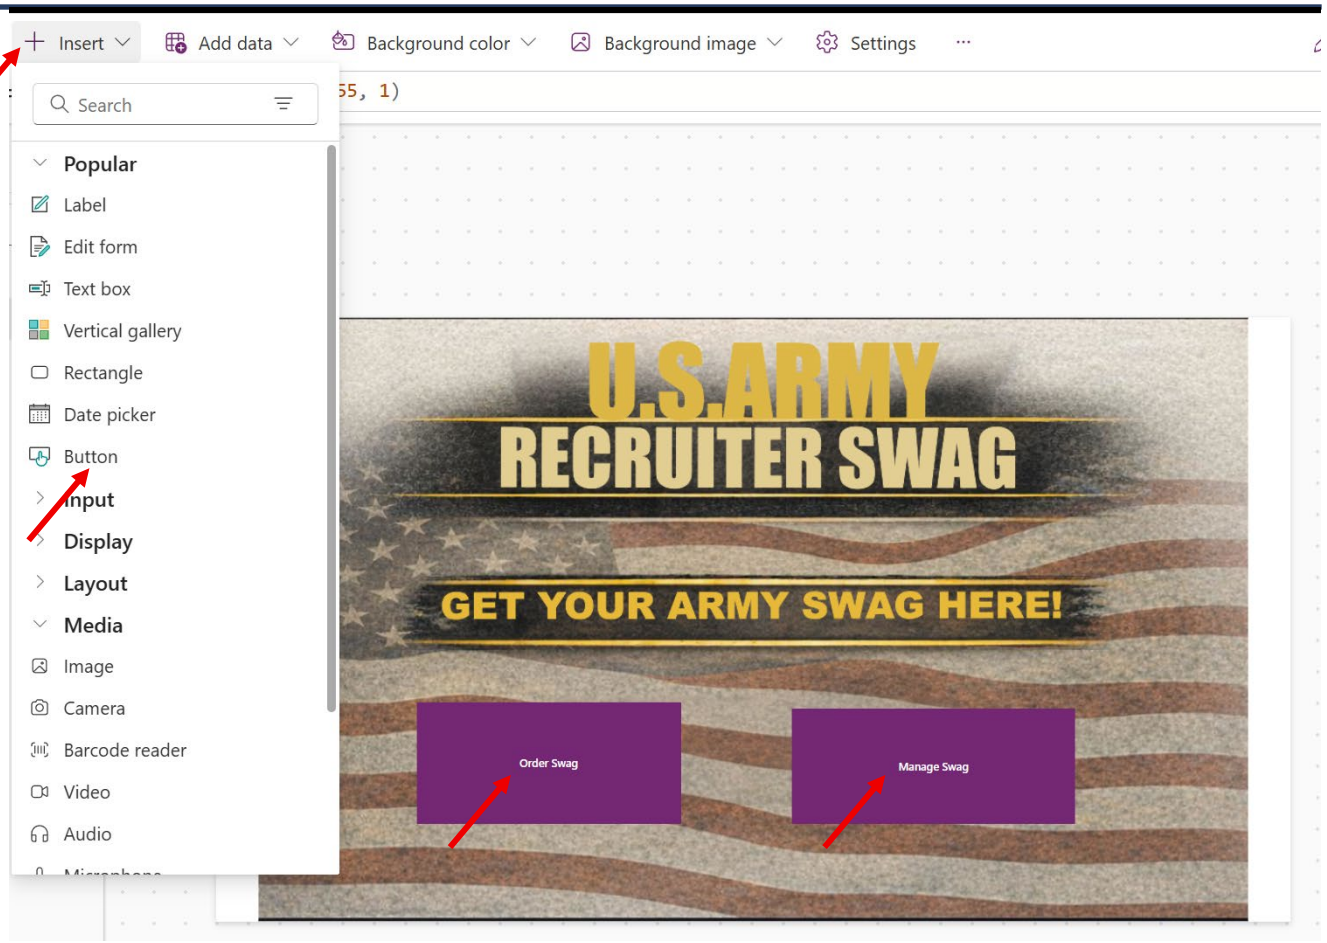


Creating a Home Page

Step 3: Create Buttons to Navigate

- Click **Insert → Button (x2)**
- Change the “Button” text to “Manage Swag” and “Order Swag”
- Copy and Paste the following into the Onselect Control:
  - Navigate('Recruiter Order Portal’)
  - Navigate(ProductManagement)

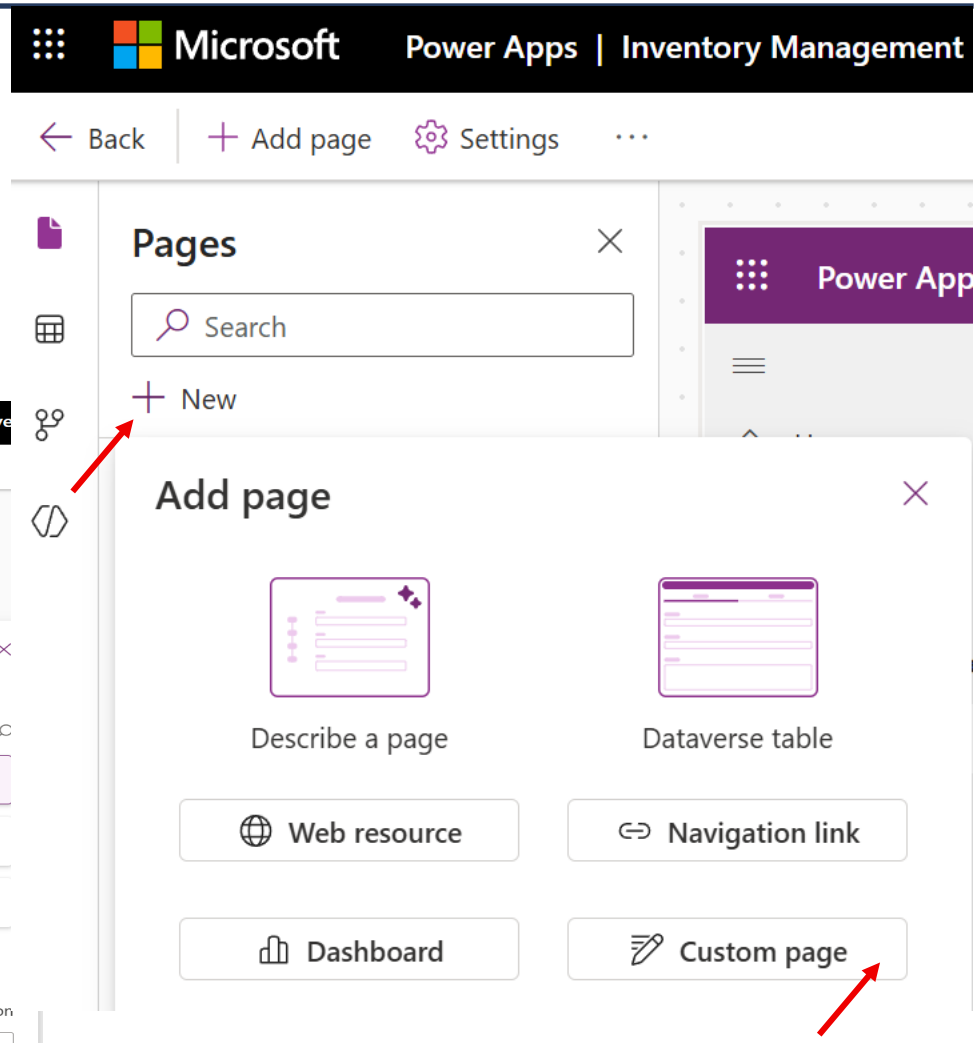
Save and Publish as Needed



Embed a Home Page

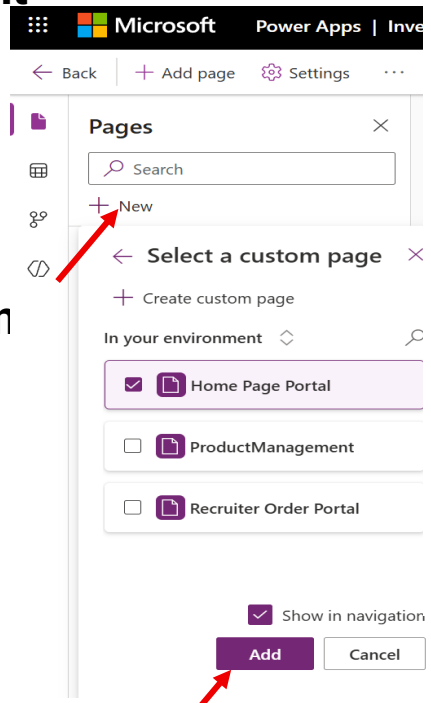
Step 1: Create a Custom Page

- Go to **Power Apps** → **Solutions** (open the existing solution “Inventory Management”).
- Click **Pages** and Validate Pages then **Publish All**
  - **Hard Refresh (F5)**
- Click **Apps** → **Inventory Management**



Step 2:

- Select “New” and the newly created “Home page”
- Click **Add (Keep “Show in Navigation**



Step 3:

- Change the Name and Location
  - Select the “…” for moving
    - Moving to Top makes it first to load
  - Click on the name for title change

Questions?

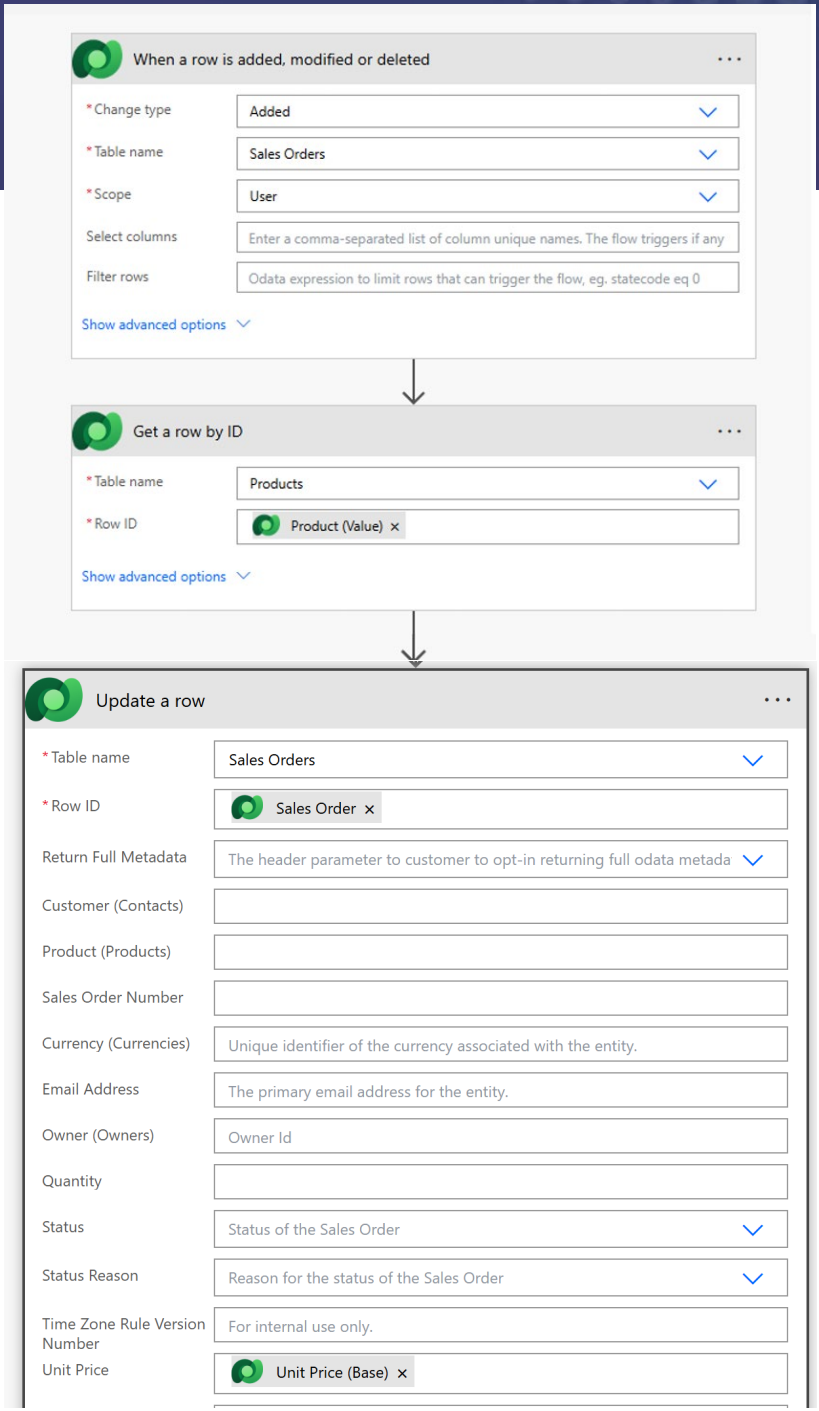
15-minute break!

Use Power Automate to update Value

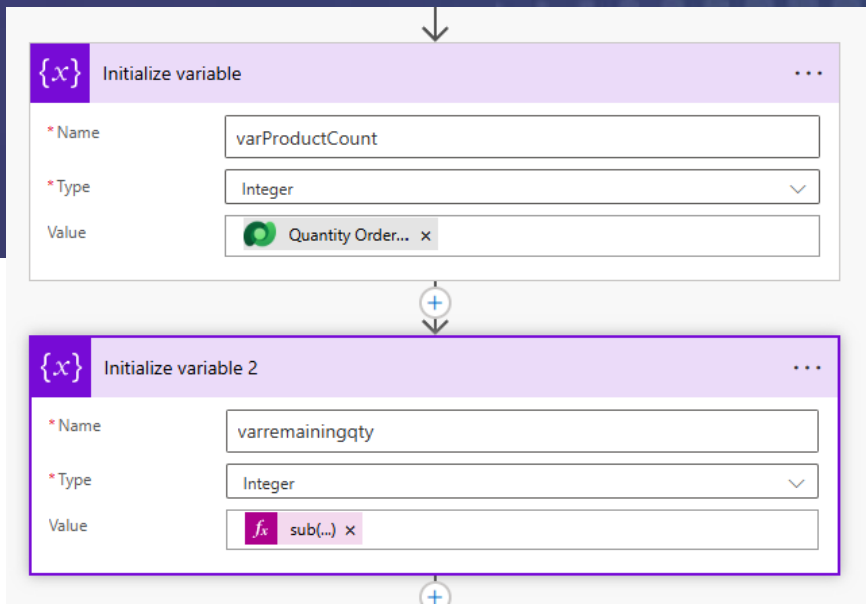
Objective:
Teach participants how to use Power Automate to automatically update critical data fields such as product sales price and remaining inventory when a sales order is created, ensuring accuracy, consistency, and real-time system updates.

Steps:

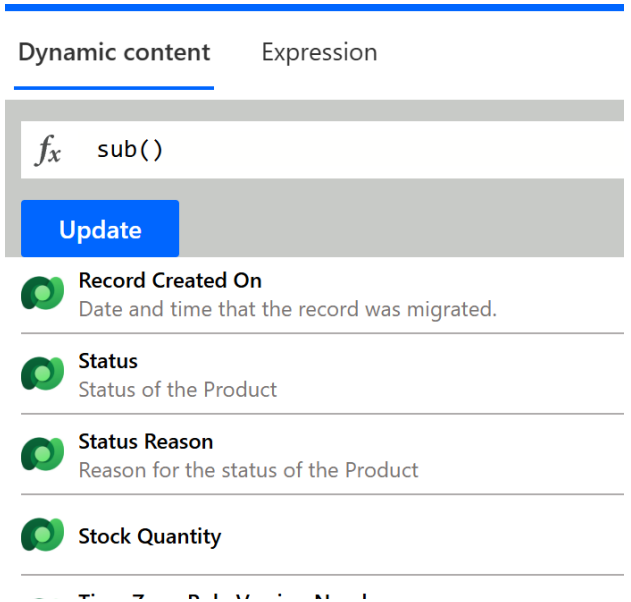
1. Select New > Automation > Cloud Flow > Automated
2. **Name the flow: Sales Order Line – Set Unit Price**
3. Choose your flow's trigger, enter: 'Dataverse' in search box
4. Select trigger 'When a row is added, modified or deleted'
5. Select Create
6. Change Type: 'Added', Table Name: 'Sales Orders', Scope: 'User'
7. Select New Step
8. Under 'Choose an operation': select the 'Microsoft Dataverse' icon, and select action 'Get a row by ID'
9. Enter Table name: 'Products'
10. Click mouse on Row Id and Enter 'Product(Value)' from the Dynamic content list
11. Select New Step
12. Choose an operation: 'Microsoft Dataverse'
13. Select Update a Row (you may have to scroll down or search in search box): Table Name: 'Sales Order'
14. For Row ID select 'Sales Order' from Dynamic content list
15. Open the show advanced options and scroll down to Unit Price
16. Enter 'Unit Price (Base)' in the Dynamics content list



Using an Initialize Variable to deduct the inventory

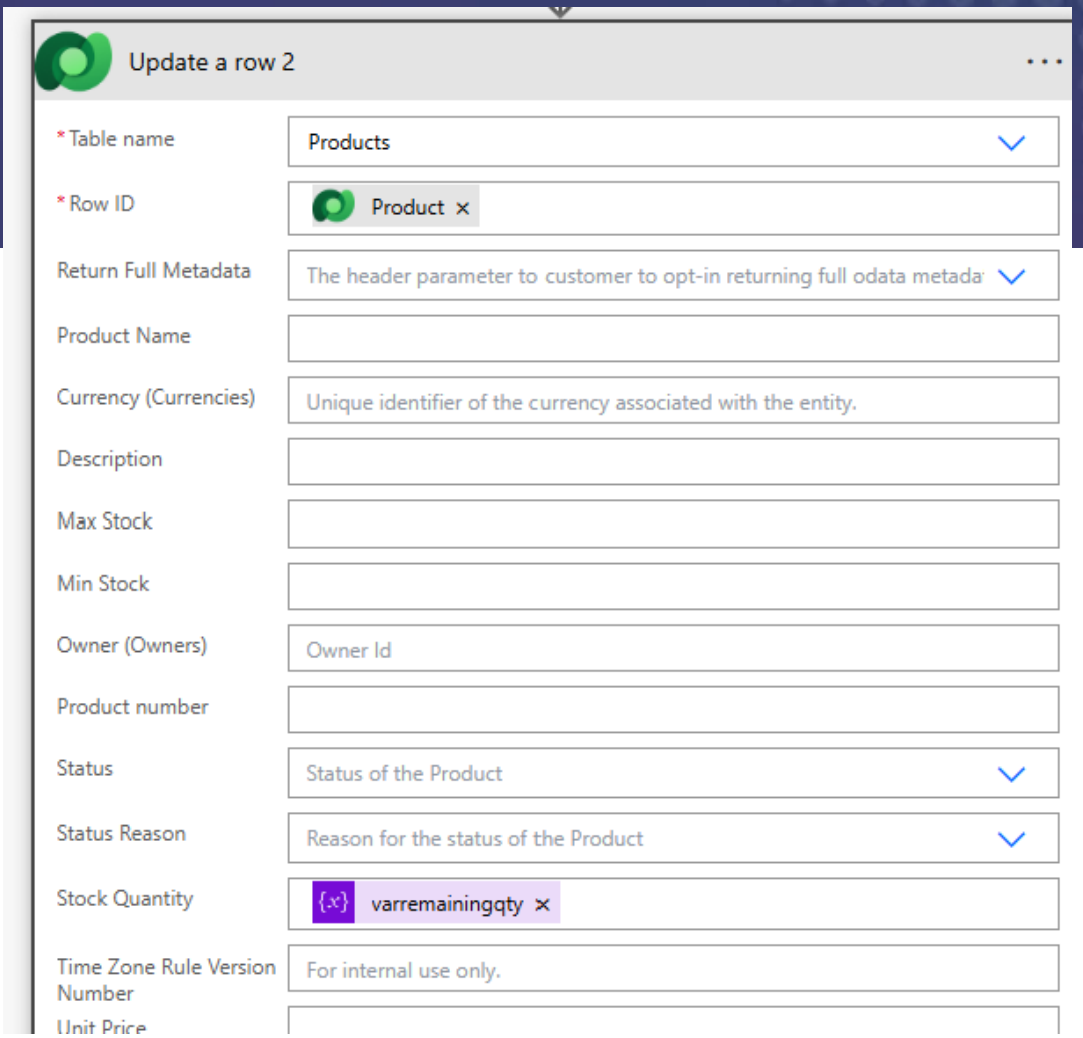


17. Select New Step
18. Search 'Initialize variable'
19. Enter Variable name: **varProductCount**
20. Select Type: Integer
21. Select Value: '**Quantity Ordered**' from Dynamic content
22. Select New Step
23. Search 'Initialize variable'
24. Enter Variable name: **varRemainingQty**
25. Select Type: Integer
26. Click on Value box and select **Expression tab** and in the **fx** field type **sub()**
    - **Place cursor in between parenthesis**
    - Then switch to **Dynamic Content**
    - Locate and select **Stock Quantity** under **Get a row by ID** action
        - *You may need to open "See More"*
    - At the end of the current expression type a comma: **,**
    - After the comma, you will locate and add **Quantity Ordered** from the **When a Row is Added, Modified, Deleted** action
    - Press **Ok**



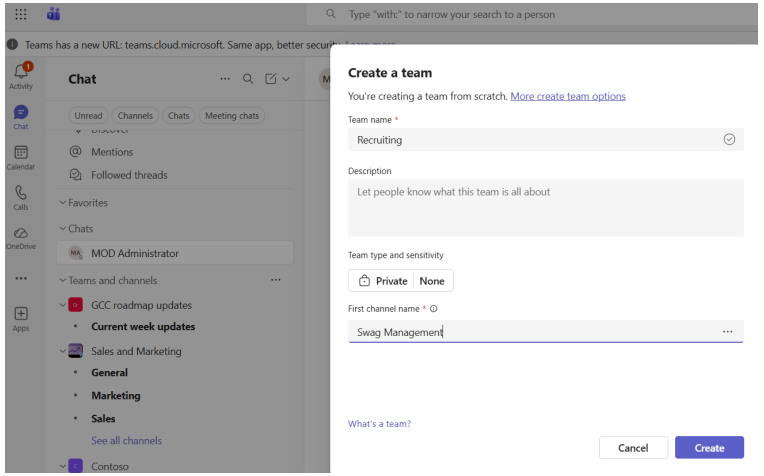
Use the variable to now update the value in the column

29. Choose an operation: **Microsoft Dataverse**
30. Select **Update a Row**
31. Select **Products** for **Table Name**
32. **For Row ID:** select **Product** from **Get a row by ID** section of Dynamic content tab
33. Select **Show Advanced options**
1. For the attribute **Stock Quantity,** find and use **varRemainingQty** from the **Dynamic content**
29. Click **Save** button
30. Your flow is ready to be used, please turn it on!

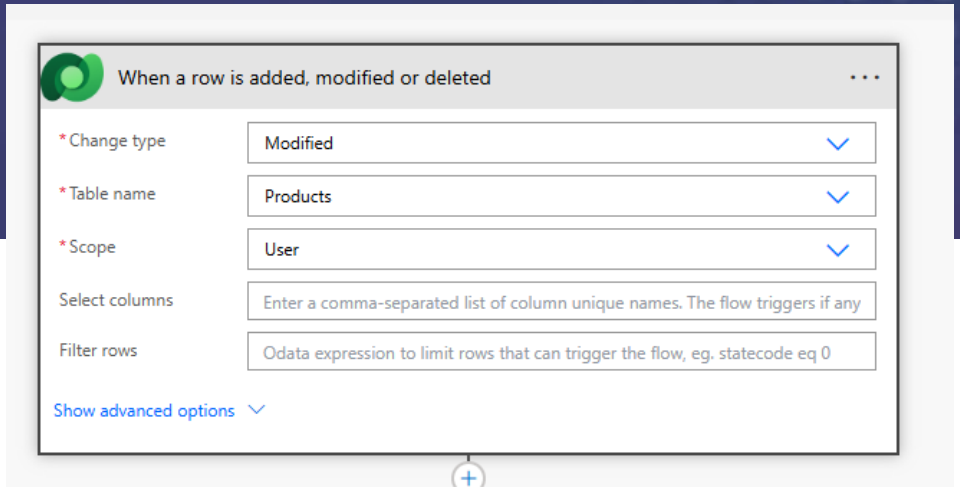


Trigger Teams notification via Power App flow

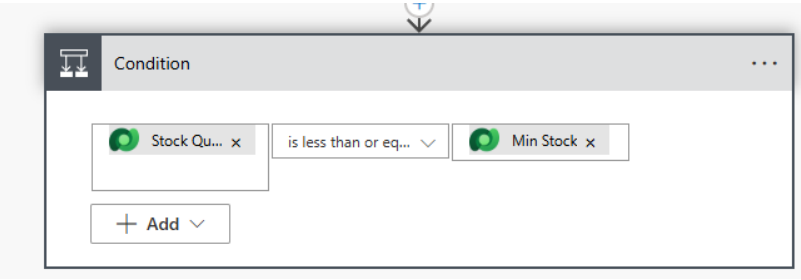
Objective:
Creating a Cloud Flow is intended to streamline Microsoft Teams notifications for the inventory manager by automating how updates are communicated. When the flow is enabled, any inventory changes or exceptions are immediately surfaced as alerts and posted to the dedicated Teams channel where the inventory management group works together. This approach keeps stakeholders informed without delay and supports coordinated, efficient inventory oversight.



STEP 1: Create the trigger

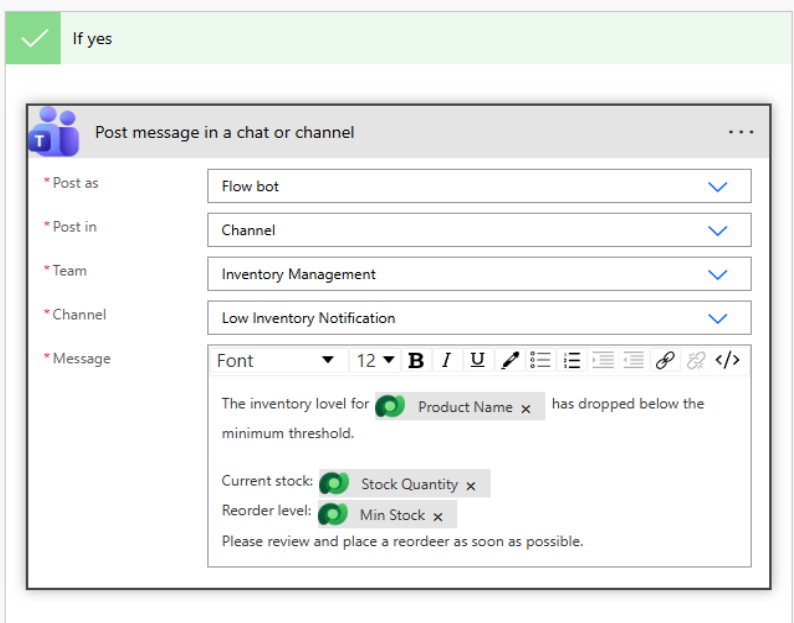


Step 2: Create the Control Condition



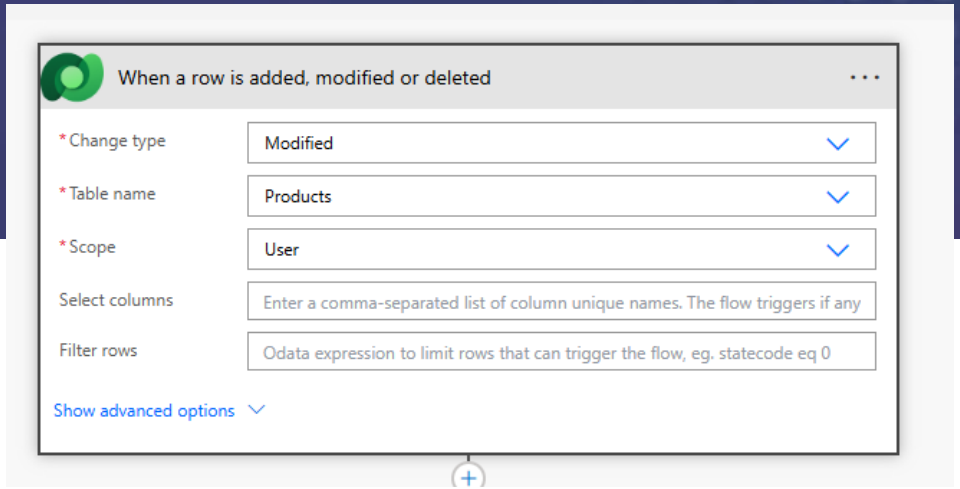
Step 3: Create the connector and Message

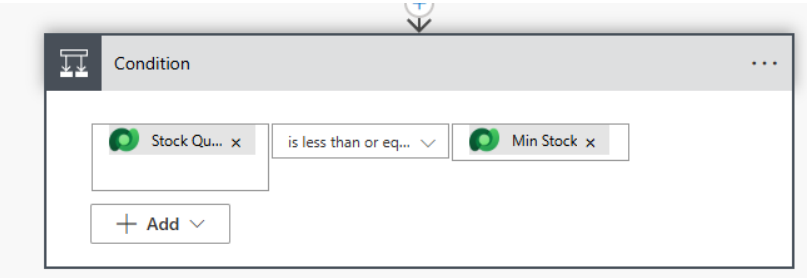
(*Note: Create Team and Channel in your environment)

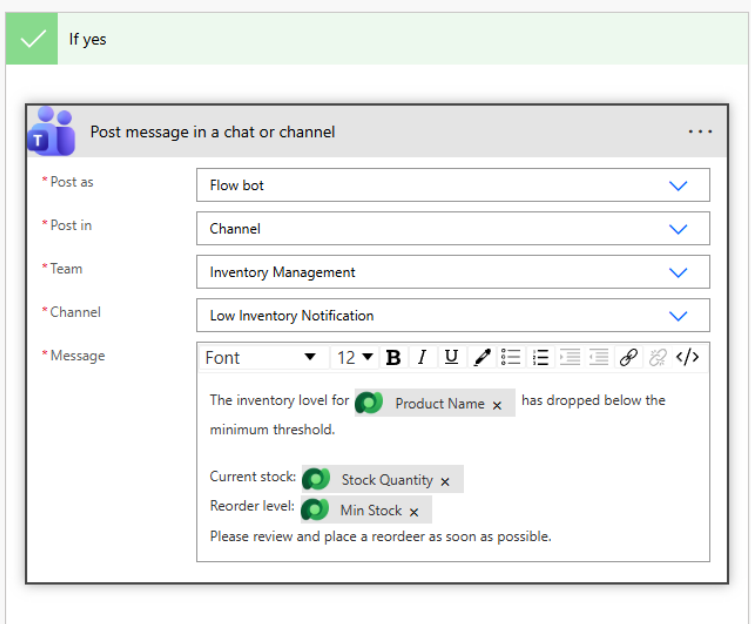


Trigger Teams notification via Power App flow

1. Select New > Automation > Cloud Flow > **Automated**
2. Name the flow: **Low Inventory**
3. Choose your flow's trigger, enter: **Dataverse**
4. Select **When a row is added, modified or deleted**
5. Select **Create**
6. Enter Change type as **Modified**
7. Enter Table name as **Products**
8. Enter Scope as **User**
9. Select **New Step**
10. Search for **Control** group and choose **Condition**
11. In the **Choose a value** field, select **Stock Quantity** in Dynamic content
12. Select the math value **is less than or equal to**
13. In the **Choose a value** field, select **Min Stock** in Dynamic content
14. In the conditions, where it states, "If yes", select **Add an Action**
15. Search **Teams and select ***
16. Search for **Post Message in a chat or channel**
17. **Post as** will default to **Flow Bot,** that's what we'll keep here
18. Change **Post In** to **Channel**
19. Select the **Teams** from the drop down
20. Select the **Channel** in the **Channel** drop down
21. Create the designed memo as noted in the screenshot
22. Save the flow







Results of the Teams notification via Power App flow
